AC AA This sequence represents the CYCD1;1 cDNA from Zea mays which encodes a D-type cyclin. The sequence can be used to alter the growth characteristics or architecture of plants by altering the (functional) level in the plant cells of a cell-division controlling protein that can bind to, or phosphorylate, an Rb-like protein, such as a D-type cyclin. Modulation of the cyclin gene is used to increase or decrease the growth rate, provide faster germination, reduce time to flowering, increase number of flowers, seeds or fruits per plant, increase root development,

Novel polynucleotides related proteins and a s encoding maize cyclin D antisense RNA useful for control of cell cy nd 3, cycle

Claim 1; Page 115-117; 134pp; English

cc modulating the level of CycD protein in a cell comprises
CC transforming the cell with a recombinant expression cassette
CC comprising a CycD polynuclectide linked to a promoter, and
CC growing the cell for a time sufficient to induce expression of the
CC growing the cell for a time sufficient to induce expression of the
CC cycD protein in the cell. The CycD protein is present in an amount
CC sufficient to alter cell division, increase or decrease) the
CC dividing, improve transformation frequencies, alter cell growth,
CC increase the growth rate, increase crop yield, alter plant
CC tassel, stalk, pollen, stamen) growth, produce organ ablation,
CC produce parthenocarpic fruits, produce male sterile plants,
CC enhance embryogenic response, increase callus induction, provide
CC cycle, improve response to environmental stress including
CC protein in the cells is transiently modulated by introducing
CC cycl RNA or Cycl polypeptides. Cycl polynucleotides can be used
CC cycl RNA or Cycl interacting proteins. All claimed. gene that encodes cyclin D (CycD, see AN7/9321), a protein necessary for progression from G1 into S phase. The encoded protein binds to CDK4, and the active CycD-CDK4 hyperphosphorylates retinoblastoma associated protein, releasing the E2F transcription factor which activates DNA synthesis. The invention provides maize CycD polynucleotides (see AN294581-84) and polypeptides (see AN79321-24) that are involved in cell cycle regulation. Also provided are recombinant expression cassettes (including ZmCycD in sense or antisense orientation), host cells, transgenic plants (especially corn, sorghum, sunflower, safflower, wheat, rice, alifalfa or oilseed Brassica) and antibody compositions. The present sequence is that of an isoform of the maize ZmCycD gene that encodes cyclin D (CycD, see AAY79321), a protein nec A claimed method of

The Cycl protein is present in an amount converges the protein in the cell. The Cycl protein is present in an amount converges the protein in the cell division, increase the number of cells increase the growth rate, increase crop yield, alter plant height or size, enhance or inhibit organ (seed, root, shoot, ear, tassel, stalk, pollen, stamen) growth, produce organ ablation, produce parthenocarpic fruits, produce male sterile plants, produce parthenocarpic fruits, produce male sterile plants, cenhance embryogenic response, increase callus induction, provide positive selection, increase plant regeneration, alter the time that cells are arrested in Gl or GO phase or in a particular cell cycle, improve response to environmental stress including dehydration, heat or cold, increase the number of seeds per pod or ear, alter the lag time in cell increase the number of seeds per pod or ear, alter the lag time in seed development, provide hormone-independent cell growth, or increase the growth rate of cells in bioreactors. The level of cyclo protein in the cells is transiently modulated by introducing cyclo protein in the cells is transiently modulated by introducing conditions to identify Cycl interacting proteins. All claimed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              grown plants. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a xhoI restriction site and a 3' anchor. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript into the EcoRI-XhoI restriction site of the pBluescript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /tissue_type="whole seedlings of greenhouse grown plants"

/note="Vector: pBluescript was constructed from mRNA isolated
germinating shoots of the cultivar Williams. The seeds
were allowed to germinate for 24 hours prior to being
cold stressed for 2 days at 4C. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with a XhoI restriction site. EcoRI
adapters were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The cDNA fragments were
directionally cloned into the EcoRI-XhoI restriction site
of the pBluescript vector. The ligated cDNA fragments were
transformed into DH10B host cells (GibcoBRL). This library
was constructed in the laboratory of Dr. Randy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /organism="Glycine max"

/note="Vector: Lambda Zap; cDNA was prepared from polyA+
enriched, pooled samples of equivalent amounts of total
eNAN from very young, developing, fully-opened flowers and
flowers transitioning into pods. The cDNA was
directionally ligated into the Uni-Zap XR vector
(Stratagene) and packaged using the Gigapack III Gold
packaging extracts. Phagemids containing cDNA inserts were
in vivo excised from the recombinant Uni-ZAP XR vector
using ExAssist helper phage and the E. coli strain
XLI-Blue MRF' (Stratagene). Excised plasmids were plated
using SOLR cells."

Site_2: NotI; This cDNA library was constructed from mRNA
isolated from hypocotyl and plumule tissues of seeds
germinated for three days of the cultivar Williams.
Complementary DNA was synthesized from mRNA using a primer
consisting of a poly(dT) sequence with a NotI restriction
site. EcoRI adapters were ligated to the blunt-ended cDNA
fragments followed by digestion with EcoRI and NotI. The
cDNA fragments were directionally cloned into the
EcoRI-NotI restriction site of the pT7T3-Pac vector. The
ligated cDNA fragments were transformed into DH10B host
cells (Gibco BRL). This library was constructed by Dr.
Randy Shoemaker.*

/note="Vector: pT773Pac (Pharmacia); Site_1: EcoRI; Site_2: NotI; This cDNA library was constructed from mRNA isolated from hypocotyl and plumule tissues of seeds germinated for three days of the cultivar Williams. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a NotI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by digestion with EcoRI and NotI. The CDNA fragments were directionally cloned into the EcoRI. NotI restriction site of the pT773-Pac vector. The ligated cDNA fragments were transformed into DH10B host cells (Gibco BRL). This library was constructed by Dr.

This library was made from sections of dormant tuber, avoiding the buds and epidermis. Tubers were stored for one month post-harvest at 40°C. The tuber was peeled, well away from the surface. Then it was chopped into 1-2 mm cubes and immediately frozen in liquid nitrogen. This library is noted as P4 in Tanksley lab notebooks."

The cDNA was directionally ligated into the Uni-ZAP XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were exclsed from the recombinant lambda-ZAP phage using Ex-Assist helper phage and propagated in XLOLR cells. Note: EST may be of fungal origin."

                                                                                                                                                                                                               /note="Vector: pBK-CMV; Site_1: EcoRI; $ite_2: XhoI; This cDNA library was constructed from polyA enriched mRNA from field grown leaves. Mid-size actively growing leaves were collected and pooled from several plants and frozen immediately after harvesting in liquid hitrogen. The cDNA was prepared using an XhoI-poly(dT) linker-primer. An EcoRI adapter was ligated to the blunt lend cDNA and the products were digested with EcoRI and thoI enabling directional cloning into the lambda ZAP Express vector. The library was amplified using the host strain XLI-Blue MRF'. Mass excision of the library was performed to obtain pBK-CMV phagemid clones in the host strain XLOIR. Single pass DNA sequencing was performed using the T3 promoter primer: 5' ATTAKCCCTCACTANAGGGA 3'. This library was constructed by Alex Richman."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cr This is the deduced amino acid sequence of a corn cyclin delta-1 cc protein derived from the nucleotide sequence (see AAZ1958) of a cc contig composed of clones isolated from soybean Authority (TM) cc herbicide-sprayed and soybean root ear cDNA libraries. It crepresents the entire protein. The invention relates to isolated cc nucleic acid fragments (see AAZ1953-66) encoding cyclin A, cyclin cc delta-1, cyclin delta-2 and cyclin delta-3 polypeptides (see CC AAY31889-902). It also relates to the construction of chimeric genes cc encoding all or a portion of a cyclin, in sense or antisense cc encoding all or a portion of a cyclin, in sense or antisense cc elementation, where expression of the chimeric gene results in altered cc elements of the cyclin protein in a transformed host cell. This would cc have the effect of altering the regulation of cell division in those cc cells. The nucleic acid fragments may be used to express cyclins in cc plant cells to enhance cell tissue culture growth. The availability co f mucleic acid sequences encoding all or a portion of cyclins should cc enhance cell growth in tissue culture, increase the efficiency cof gene transfer and help provide more stable transformations. The construction of inhibitors of those enzymes that may be useful as constructions.
                                                                                                                                                                                                                                                                                                                                                              밁

                                                                                                                                                                                                                                                                                                                                                                                                                                    QY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC protein derived from the nucleotide sequence (see AAZ1955) of a CC clone isolated from a soybean embryo cDNA library. It represents CC 95% of the entire protein. The invention relates to isolated CC nucleic acid fragments (see AAZ1953-66) encoding cyclin A, cyclin CC delta-1, cyclin delta-2 and cyclin delta-3 polypeptides (see CC AAY31889-902). It also relates to the construction of chimeric genes CC encoding all or a portion of a cyclin, in sense or antisense CC encoding all or a portion of a cyclin, in sense or antisense CC elevels of the cyclin protein in a transformed host cell. This would CC levels of the cyclin protein in a transformed host cell. This would CC levels of the cyclin protein in a transformed host cell. This would CC ells. The nucleic acid fragments may be used to express cyclins in CC cells. The nucleic acid fragments may be used to express cyclins in CC plant cells to enhance cell tissue culture growth. The availability CC of nucleic acid sequences encoding all or a portion of cyclins should CC to enhance cell growth in tissue culture, increase the efficiency CC of gene transfer and help provide more stable transformations. The CC proteins can be used as targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as
                                                                                                                                                                                           δã
                                                                                                                                                                                                                             밁
